

Project Report: Household Services Application

Name: Jems Jayswal

Student id: 23f3004103@ds.study.iitm.ac.in

1. Project Statement:

- Title: Household Services Application
- Description: It is a multi-user app (requires one admin and other service professionals/ customers) which acts as a platform for providing comprehensive home servicing and solutions.

2. Frameworks:

- Flask for application code
- Jinja2 templates for HTML generation and styling
- Flask-SQLAlchemy for data management
- Matplotlib for plotting graphs

3. Process, Challenges and Solutions:

- Started with making simple html pages as per the design given in the project wireframe and slowly added css to make things look good
- Added routes for the functionalities and linked them with respective html pages
- Initially had problems designing the looks with the help of css but later took help from ChatGPT and W3school.com
- Faced problems in making the relationships of models, solved it by learning it from the sqlalchemy official website

4. Functionalities:

- Customers and Professionals can sign up by providing the details and get registered to the application
- With the help of python conditions and functions, users are able to redirect to their respective pages based on the roles after authentication
- Admin can add, edit and delete the services and packages. Also block, unblock and delete any user. Approve and Reject a new professional wanting to register.
- Search functionality based on several search options and search keywords
- View functionality in most of the tables that gives details of that particular item

5. E-R Diagram:

6. Conclusion:

- This project successfully creates a multi-user platform for household services, providing specific functionality for admin, professionals, and customers
